

RETATRUTIDE

Triple Agonist Peptide

Weight Management • Metabolic Health • Appetite Regulation

WHAT IS RETATRUTIDE?

Retatrutide (LY3437943) is a novel investigational peptide and triple hormone receptor agonist targeting GLP-1, GIP, and glucagon receptors. It is studied for its potent effects on weight loss, blood sugar control, and metabolic function.

HOW IT WORKS

GLP-1 Receptor

Reduces appetite, slows gastric emptying, improves insulin secretion.

GIP Receptor

Enhances insulin response and supports fat metabolism.

Glucagon Receptor

Increases energy expenditure and promotes fat breakdown.

AREAS OF RESEARCH INTEREST

- Significant Weight Loss (up to 20-30% in studies)
- Improved Glycemic Control & Insulin Sensitivity
- Reduced Appetite & Enhanced Satiety
- Metabolic Health & Cardiovascular Benefits
- Potential Liver Fat Reduction (e.g., NASH)
- Overall Energy Expenditure & Body Composition

COMMON RESEARCH APPROACHES

Administered as a once-weekly injectable in research settings. Often studied in combination with diet, exercise, and lifestyle modifications for synergistic metabolic effects.
