

AOD-9604

Growth Hormone Fragment

Fat Loss · Metabolic Support

What Is AOD-9604?

AOD-9604 is a modified fragment of human growth hormone (hGH 177-191). It is researched for its ability to stimulate lipolysis (fat breakdown) without the full growth-promoting effects of HGH.

How It Works

Lipolysis Stimulation	Metabolic Effects	Targeted Action
Activates fat breakdown in adipose tissue.	Increases fat oxidation without significantly affecting blood sugar or muscle growth.	Mimics the fat-loss portion of HGH with high specificity.

Areas of Research Interest

- Targeted fat loss (especially abdominal)
- Improved metabolic rate
- Potential obesity treatment research
- Minimal impact on blood sugar
- Support for body composition

Common Research Approaches

Subcutaneous injection in metabolic and weight-loss studies. Often researched as a more targeted alternative to full HGH for fat-reduction protocols.

FOR RESEARCH PURPOSES ONLY · NOT FOR HUMAN CONSUMPTION
