

ARA-290

Cibinetide · Innate Repair Receptor Agonist

Tissue Protection · Anti-Inflammatory · Neuropathic Support

What Is ARA-290?

ARA-290 (also known as Cibinetide) is a non-hematopoietic peptide derived from erythropoietin. It selectively activates the innate repair receptor (IRR) and is researched for tissue-protective, anti-inflammatory, and neuropathic pain–modulating effects without stimulating red blood cell production.

How It Works

Innate Repair Receptor	Anti-Inflammatory Action	Neuropathic Support
Selectively activates the IRR complex to trigger tissue-protective pathways.	Modulates inflammatory signaling and supports resolution of tissue stress.	Researched for effects on small-fiber neuropathy and nerve comfort.

Areas of Research Interest

- Small-fiber neuropathy and neuropathic discomfort
- Tissue protection and repair signaling
- Anti-inflammatory and immune-modulating research
- Sarcoidosis and related inflammatory conditions
- Metabolic and systemic resilience endpoints

Common Research Approaches

Typically studied via subcutaneous administration. Research protocols often explore daily or near-daily dosing in models of neuropathy, inflammation, and tissue stress.
