

BAC WATER

Bacteriostatic Water

Peptide Reconstitution · Sterile Diluent

What Is Bac Water?

Bacteriostatic Water (Bac Water) is sterile water containing 0.9% benzyl alcohol as a preservative. It is the standard diluent used to reconstitute lyophilized (freeze-dried) peptides and research compounds, allowing multiple withdrawals from the same vial.

How It Works

Sterile Base Provides a clean, pyrogen-free liquid medium for dissolving peptides.	Benzyl Alcohol 0.9% Acts as a bacteriostatic agent that inhibits bacterial growth, enabling multi-dose use.	Reconstitution Gently mixed with lyophilized powder to create a stable injectable solution.
--	---	---

Key Facts & Best Practices

- Allows multiple sterile draws from one vial (typically 28 days after first use)
- Preferred over plain sterile water for multi-dose peptide research
- Does not significantly affect peptide stability in most cases
- Must be used with proper aseptic technique and sterile syringes
- Store refrigerated after opening; protect from light and contamination

Important Research Notes

Use only for reconstitution of research peptides. Never inject large volumes of bacteriostatic water alone. Discard after the recommended multi-use period or if cloudiness, particles, or contamination appear. Always follow aseptic handling protocols.

FOR RESEARCH PURPOSES ONLY · NOT FOR HUMAN CONSUMPTION
