

IPAMORELIN

Growth Hormone Secretagogue

Muscle Growth · Fat Loss · Recovery

What Is Ipamorelin?

Ipamorelin is a selective pentapeptide growth hormone secretagogue (GHS). It stimulates the pituitary gland to release growth hormone with high specificity and minimal impact on cortisol or prolactin.

How It Works

GH Release	Selective Action	Synergistic Use
Mimics ghrelin to pulse GH secretion without strong hunger signals.	Promotes lean muscle, fat metabolism, and recovery with fewer side effects.	Often stacked with CJC-1295 for amplified effects.

Areas of Research Interest

- Increased lean muscle mass and strength
- Enhanced fat loss and body composition
- Improved recovery and sleep quality
- Better skin elasticity and anti-aging
- Joint and tissue support

Common Research Approaches

Subcutaneous injection, often multiple times daily. Frequently researched in combination with other GHRH peptides for optimal GH pulses.
