

RESEARCH ONE-PAGER

Ipamorelin

Selective GH secretagogue · GH-axis research

10 mg lyophilized vials

OVERVIEW

Ipamorelin is a selective growth-hormone secretagogue. It is studied for asking the pituitary for a GH pulse with less of the side-signal (hunger, cortisol, prolactin) that older secretagogues were known for.

IN PLAIN LANGUAGE

Think of Ipamorelin as a “clean GH pulse” research tool. People look at it when they want growth-hormone signaling without as much of the hunger or stress-hormone noise that came with earlier compounds.

WHAT RESEARCHERS LOOK AT

- Growth-hormone pulses with a more selective receptor profile
- Recovery and overnight repair-style GH-axis research
- Less hunger-signal and cortisol-signal noise than older GHRPs
- Often paired with a GHRH analog (CJC-1295 or Tesamorelin) in combination studies
- Lean-mass and sleep-associated GH research models

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water. Invert gently until dissolved; do not shake vigorously. A common laboratory starting point is 2 mL bacteriostatic water per 10 mg of peptide (5 mg/mL). Match the volume to the vial on the bench and confirm against the laboratory SOP. Aliquot if the design requires repeated sampling. Offered as 10 mg lyophilized vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.
