

RESEARCH ONE-PAGER

PT-141

Bremelanotide-related · melanocortin / CNS research

10 mg lyophilized vials

OVERVIEW

PT-141 is a melanocortin-receptor research peptide. It is studied in the central nervous system for desire and arousal signaling — a brain pathway, not a blood-flow (vascular) pathway.

IN PLAIN LANGUAGE

Think of PT-141 as a “desire is a brain signal” research tool. People look at it for central melanocortin biology, distinct from compounds that only change blood flow.

WHAT RESEARCHERS LOOK AT

- Central desire and arousal-pathway research
- Melanocortin-receptor signaling in the brain
- A CNS approach, not a vascular one
- Mood-adjacent melanocortin literature
- Distinct from skin-pigment melanotan research

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water. Invert gently until dissolved; do not shake vigorously. A common laboratory starting point is 2 mL bacteriostatic water per 10 mg of peptide (5 mg/mL). Match the volume to the vial on the bench and confirm against the laboratory SOP. Aliquot if the design requires repeated sampling. Offered as 10 mg lyophilized vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.

Questions on this vial? Paul and Thabby review every request.
