

RESEARCH ONE-PAGER

SNAP-8

Octapeptide · neuromuscular / dermal research

10 mg lyophilized vials

OVERVIEW

SNAP-8 is a short peptide studied for the SNARE complex — the tiny machinery that tells a muscle to fire. In dermal research, that question is about expression lines and how strongly a facial muscle is signaled.

IN PLAIN LANGUAGE

In plain language, SNAP-8 is looked at as a topical-research cousin of “relax this expression line.” It is not a GH or repair peptide. It is a signaling peptide for how strongly a small muscle is told to contract.

WHAT RESEARCHERS LOOK AT

- Expression-line and dermal-appearance research
- SNARE-complex neuromuscular signaling
- A gentler research alternative to heavier neuromodulators
- Often discussed in cosmetic-science literature
- Not a tissue-repair or metabolic peptide

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water. Invert gently until dissolved; do not shake vigorously. A common laboratory starting point is 2 mL bacteriostatic water per 10 mg of peptide (5 mg/mL). Match the volume to the vial on the bench and confirm against the laboratory SOP. Aliquot if the design requires repeated sampling. Offered as 10 mg lyophilized vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.

Questions on this vial? Paul and Thabby review every request.
