Epithalon

Epitalon · telomere and circadian research

10 mg lyophilized vials

OVERVIEW

Epithalon (epitalon) is a four-amino-acid pineal peptide. It is studied for telomere biology (the caps on DNA) and for circadian / pineal signaling — aging-biology, not a GH or repair peptide.

IN PLAIN LANGUAGE

Think of Epithalon as an aging-biology and sleep-clock peptide. People look at it for cellular aging questions and for a steadier day-night signal, not for tissue knit or appetite.

WHAT RESEARCHERS LOOK AT

- Telomere and cellular-aging research
- Pineal and circadian-clock signaling
- Sleep-timing and restoration-style models
- A bioregulator, not a secretagogue
- Often discussed next to Pinealon on the aging shelf

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water. Invert gently until dissolved; do not shake vigorously. A common laboratory starting point is 2 mL bacteriostatic water per 10 mg of peptide (5 mg/mL). Match the volume to the vial on the bench and confirm against the laboratory SOP. Aliquot if the design requires repeated sampling. Offered as 10 mg lyophilized vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.
