

RESEARCH ONE-PAGER

GHK-Cu

Copper tripeptide · skin and connective-tissue research

50 mg and 100 mg lyophilized vials

OVERVIEW

GHK-Cu is a naturally occurring copper-binding tripeptide. It is one of the best-known research tools for skin, collagen, and the look of repair in dermal models — the “remodel this tissue” signal.

IN PLAIN LANGUAGE

Think of GHK-Cu as the skin-and-collagen peptide. People look at it for firmer-looking tissue, remodeling after wear, and the copper-dependent chemistry that collagen work uses. It is the backbone of Glow and KLOW.

WHAT RESEARCHERS LOOK AT

- Collagen and skin-remodeling research
- Wound-adjacent dermal repair models
- Hair-follicle and scalp-biology questions in the literature
- Antioxidant / copper-peptide chemistry
- The core of HarmonyX Glow and KLOW blends

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water or the diluent specified in the laboratory SOP. Invert gently until dissolved; do not shake vigorously. Larger milligram vials need more diluent than a 10 mg peptide — confirm the volume for the vial on the bench before starting. Aliquot if the design requires repeated sampling. Offered as 50 mg and 100 mg vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.

Questions on this vial? Paul and Thabby review every request.
