

RESEARCH ONE-PAGER

Kisspeptin-10

GnRH-pathway peptide · reproductive-endocrine research

10 mg lyophilized vials

OVERVIEW

Kisspeptin-10 sits upstream of GnRH — the signal that tells the reproductive axis to wake up. It is studied for fertility-axis biology, gonadotropin release, and how the brain talks to the gonads.

IN PLAIN LANGUAGE

In everyday terms, Kisspeptin-10 is looked at as a “start the reproductive-hormone conversation” peptide. People reach for it in hormone-axis research, not in tissue-repair or metabolic incretin work.

WHAT RESEARCHERS LOOK AT

- GnRH and reproductive-axis signaling
- LH / FSH-adjacent research questions
- Fertility-axis and hypogonadal models in the literature
- Brain-to-gonad communication
- A neuroendocrine tool, not a GH secretagogue

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water. Invert gently until dissolved; do not shake vigorously. A common laboratory starting point is 2 mL bacteriostatic water per 10 mg of peptide (5 mg/mL). Match the volume to the vial on the bench and confirm against the laboratory SOP. Aliquot if the design requires repeated sampling. Offered as 10 mg lyophilized vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.

Questions on this vial? Paul and Thabby review every request.
