MOTS-c

Mitochondrial-derived peptide · metabolic research

10 mg and 40 mg lyophilized vials

OVERVIEW

MOTS-c is a peptide the mitochondria themselves encode. It is studied as a metabolic messenger: how cells handle glucose, exercise-like signaling, and metabolic flexibility.

IN PLAIN LANGUAGE

In everyday terms, MOTS-c is looked at as an “exercise-mimetic” metabolic note from the cell’s engines. People reach for it in insulin-sensitivity, energy, and body-composition research.

WHAT RESEARCHERS LOOK AT

- Metabolic flexibility and glucose-handling research
- Exercise-like signaling in sedentary research models
- Insulin-sensitivity questions
- Mitochondrial communication, not just mitochondrial fuel
- A complement to NAD+ in a metabolic stack

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water. Invert gently until dissolved; do not shake vigorously. A common laboratory starting point is 2 mL bacteriostatic water per 10 mg of peptide (5 mg/mL). Match the volume to the vial on the bench and confirm against the laboratory SOP. Aliquot if the design requires repeated sampling. Offered as 10 mg and 40 mg lyophilized vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.
