

RESEARCH ONE-PAGER

Oxytocin

Neuropeptide · social-behavior and stress research

10 mg lyophilized vials

OVERVIEW

Oxytocin is the social-bonding neuropeptide. It is studied for trust, connection, stress-buffering, and how social context changes physiology — far beyond its textbook labor-and-milk role.

IN PLAIN LANGUAGE

In plain language, oxytocin is looked at as the “we’re safe together” signal. People reach for it in social-behavior, pair-bonding, and stress-soothing research.

WHAT RESEARCHERS LOOK AT

- Social-bonding and trust-related signaling
- Stress-buffering in social research models
- Connection, calm, and affiliative behavior
- A complement to Selank on the composure shelf
- Neuroendocrine, not a metabolic incretin

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water. Invert gently until dissolved; do not shake vigorously. A common laboratory starting point is 2 mL bacteriostatic water per 10 mg of peptide (5 mg/mL). Match the volume to the vial on the bench and confirm against the laboratory SOP. Aliquot if the design requires repeated sampling. Offered as 10 mg lyophilized vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.

Questions on this vial? Paul and Thabby review every request.
