

RESEARCH ONE-PAGER

TB-500

Thymosin beta-4 fragment · cell-migration research

10 mg lyophilized vials

OVERVIEW

TB-500 is a synthetic piece of thymosin beta-4. It is studied for how cells move into a repair site — the “get the right cells there” side of tissue research, next to BPC-157’s “knit it together” side.

IN PLAIN LANGUAGE

In everyday terms, TB-500 is looked at for flexibility of repair: cell travel, actin (the cell's scaffolding), and recovery after strain. Pair it with BPC-157 and you have the Wolverine blend.

WHAT RESEARCHERS LOOK AT

- Cell-migration into a repair site
- Flexibility, actin, and connective-tissue research
- Broader, system-level repair questions vs BPC-157’s local knit
- Inflammation and recovery-after-strain models
- The second half of HarmonyX’s Wolverine vial

LABORATORY RECONSTITUTION

Reconstitute aseptically with bacteriostatic water. Invert gently until dissolved; do not shake vigorously. A common laboratory starting point is 2 mL bacteriostatic water per 10 mg of peptide (5 mg/mL). Match the volume to the vial on the bench and confirm against the laboratory SOP. Aliquot if the design requires repeated sampling. Offered as 10 mg lyophilized vials.

STORAGE

Lyophilized: refrigerate, protected from light and moisture. After reconstitution: refrigerate and follow laboratory SOP (commonly 14–30 days with bacteriostatic water). Avoid repeated freeze–thaw cycles.

RESEARCH USE ONLY

The language above is a plain-English reading of published research interests. It is not medical advice and not a claim that this product treats, prevents, or diagnoses any condition. This material is not a drug or cosmetic, and it is not intended for human or veterinary use. HarmonyX supplies it to qualified research purchasers for laboratory work. Certificates of analysis are available on request.

Questions on this vial? Paul and Thabby review every request.
